Περιεχόμενα

1	Χρήση rpcgen	1
2	Εκτέλεση κώδικα	1
3	Ενδεικτικά τρεξίματα	3
3.1	Server και client στον ίδιο υπολογιστή	3
3.2	Server και client σε διαφορετικές IP	3
3.3	Δοκιμή concurrency	4
4	Κώδικας	5
4.1	rpc.x	5
4.2	rpc_server.c	7
4.3	rpc_client.c	9
4.4	sock_client.c	17
4.5	Makefile.rpc	23
4.6	Makefile	24

1 Χρήση rpcgen

Πριν γίνει η ανάπτυξη του client/server κώδικα, πρέπει να παραχθούν τα απαραίτητα RPC αρχεία. Στο αρχείο `rpc.x` δηλώνονται τα ονόματα και οι δομές των Remote Procedure Calls.

Παράγουμε τα client και server stubs (αρχεία στα οποία θα συμπληρωθεί ο κώδικας), καθώς και το `Makefile` για να είναι πιο εύκολη η μεταγλώττιση:

```
$ rpcgen -Ss -C > rpc_server.c
$ rpcgen -Sc -C > rpc_client.c
$ rpcgen -Sm > Makefile.rpc
```

Στο `Makefile.rpc` κάνουμε μερικές αλλαγές ώστε ο server να μην τρέχει στο background, και στην μεταγλώττιση να περιέχονται τα `rpc_client.c` και `rpc_server.c`:

```
...
TARGETS_SVC.c = rpc_server.c rpc_svc.c rpc_xdr.c
TARGETS_CLNT.c = rpc_client.c rpc_clnt.c rpc_xdr.c
...
CFLAGS += -g -DRPC_SVC_FG
RPCGENFLAGS = -C
```

2 Εκτέλεση κώδικα

Το αρχείο `sock_client.c` υλοποιεί τον client τον οποίο εκτελεί ο χρήστης. Το `rpc_client.c`, παρόλο που λέει "client", είναι ο server με τον οποίο επικοινωνεί ο `sock_client.c` και κάνει τις remote κλήσεις στον `rpc_server.c`, ο οποίος υλοποιεί τις συναρτήσεις των RPC.

Κάνουμε compile τους κώδικες:

```

$ make
make -f Makefile.rpc
rpcgen -C rpc.x
cc -O2 -pipe -g -DRPC_SVC_FG -c rpc_client.c -o rpc_client.o
cc -O2 -pipe -g -DRPC_SVC_FG -c rpc_clnt.c -o rpc_clnt.o
cc -O2 -pipe -g -DRPC_SVC_FG -c rpc_xdr.c -o rpc_xdr.o
cc -o rpc_client rpc_client.o rpc_clnt.o rpc_xdr.o -O2 -pipe -g -DRPC_SVC_FG
cc -O2 -pipe -g -DRPC_SVC_FG -c rpc_server.c -o rpc_server.o
cc -O2 -pipe -g -DRPC_SVC_FG -c rpc_svc.c -o rpc_svc.o
cc -o rpc_server rpc_server.o rpc_svc.o rpc_xdr.o -O2 -pipe -g -DRPC_SVC_FG
cc sock_client.c -o sock_client

```

Τα τρία προγράμματα εκτελούνται ως εξής:

- `./rpc_server`
- `./rpc_client [-b backlog] [-p port] hostname`
- `./sock_client [-p port] hostname`

Πριν τρέξουμε οποιοδήποτε RPC πρόγραμμα, πρέπει να αρχίσουμε το `rpcbind(8)` service (για FreeBSD):

```
# service rpcbind start
```

Αφού τρέξουμε τον server, μπορούμε να δούμε ότι τα Remote Procedure Calls έχουνει εισαχθεί στον πίνακα RPC.

Η εντολή `rpcinfo(8)` τυπώνει τον πίνακα:

```

$ ./rpc_server
$ rpcinfo

```

program	version	netid	address	service	owner
100000	4	tcp	0.0.0.0.0.111	rpcbind	superuser
100000	3	tcp	0.0.0.0.0.111	rpcbind	superuser
100000	2	tcp	0.0.0.0.0.111	rpcbind	superuser
100000	4	udp	0.0.0.0.0.111	rpcbind	superuser
100000	3	udp	0.0.0.0.0.111	rpcbind	superuser
100000	2	udp	0.0.0.0.0.111	rpcbind	superuser
100000	4	tcp6	:::0.111	rpcbind	superuser
100000	3	tcp6	:::0.111	rpcbind	superuser
100000	4	udp6	:::0.111	rpcbind	superuser
100000	3	udp6	:::0.111	rpcbind	superuser
100000	4	local	/var/run/rpcbind.sock	rpcbind	superuser
100000	3	local	/var/run/rpcbind.sock	rpcbind	superuser
100000	2	local	/var/run/rpcbind.sock	rpcbind	superuser
536870912	1	udp6	:::161.100	-	1001
536870912	1	tcp6	:::93.202	-	1001
536870912	1	udp	0.0.0.0.44.39	-	1001
536870912	1	tcp	0.0.0.0.219.61	-	1001
536870913	1	udp6	:::161.100	-	1001
536870913	1	tcp6	:::93.202	-	1001
536870913	1	udp	0.0.0.0.44.39	-	1001

536870913	1	tcp	0.0.0.0.219.61	-	1001
536870914	1	udp6	:::161.100	-	1001
536870914	1	tcp6	:::93.202	-	1001
536870914	1	udp	0.0.0.0.44.39	-	1001
536870914	1	tcp	0.0.0.0.219.61	-	1001

Οι γραμμές που ξεκινούν με 53687* είναι τα RPC που δημιούργησε ο `rpc_server`.

3 Ενδεικτικά τρεξίματα

Σε κάθε ενότητα έχω παραθέσει τα output των 3 προγραμμάτων στην τελική τους κατάσταση. Ίσως χρειαστεί λίγη μεγέθυνση...

3.1 Server και client στον ίδιο υπολογιστή

```
christos@pleb$ ./sock_client localhost
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 1
sock_client> n: 4
sock_client> arr[0]: 19
sock_client> arr[1]: 18
sock_client> arr[2]: 20
sock_client> arr[3]: 54
[sock_client] server response: 27.750
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 2
sock_client> n: 3
sock_client> arr[0]: 188
sock_client> arr[1]: 34
sock_client> arr[2]: 65
[sock_client] server response: min: 34, max: 188
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 3
sock_client> a: 4.56
sock_client> n: 3
sock_client> arr[0]: 5
sock_client> arr[1]: 7
sock_client> arr[2]: 10
[sock_client] server response: [22.800, 31.920, 45.600]
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 4
christos@pleb$
```

```
christos@pleb$ ./rpc_server

christos@pleb$ ./rpc_client localhost
[rpc_client] accepted client at sock: 4
[rpc_client] sock: 4 server response: avg: 27.750
[rpc_client] sock: 4 server response: min: 34, max: 188
[rpc_client] sock: 4 server response: [22.800, 31.920, 45.600]
[rpc_client] sock 4 disconnected
```

3.2 Server και client σε διαφορετικές IP

Ο RPC server τώρα τρέχει σε FreeBSD Jail, το οποίο, αν και βρίσκεται στο ίδιο τοπικό δίκτυο, έχει διαφορετική IP διεύθυνση. Ο RPC client και ο socket client τρέχουν ακόμα στο τρέχουν ακόμα στον localhost.

```

christos@pleb$ ./sock_client localhost
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 1
sock_client> n: 3
sock_client> arr[0]: 1
sock_client> arr[1]: 2
sock_client> arr[2]: 3
[sock_client] server response: 2.000
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 2
sock_client> n: 4
sock_client> arr[0]: 10
sock_client> arr[1]: 20
sock_client> arr[2]: 123
sock_client> arr[3]: 23
[sock_client] server response: min: 10, max: 123
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 4
christos@pleb$

# ifconfig | grep 192
    inet 192.168.1.6 netmask 0xfffff00 broadcast 192.168.1.255
# service rpcbind onestart
Starting rpcbind.
# ./rpc_server

christos@pleb$ ./rpc_client 192.168.1.6
[rpc_client] accepted client at sock: 4
[rpc_client] sock: 4    server response: avg: 2.000
[rpc_client] sock: 4    server response: min: 10, max: 123
[rpc_client] sock 4 disconnected

```

[1] 0:sock_client*

"pleb" 03:30 03-May-22

3.3 Δοκιμή concurrency

Ο RPC server και client τρέχουν και οι δύο σε FreeBSD Jail, και αυτή τη φορά θα δοκιμάσουμε να ελέγξουμε αν ο server είναι όντως concurrent.

```

christos@pleb$ ./sock_client 192.168.1.6
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 2
sock_client> n: 4
sock_client> arr[0]: 1
sock_client> arr[1]: 2
sock_client> arr[2]: 3
sock_client> arr[3]: 4
[sock_client] server response: min: 1, max: 4
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 4
christos@pleb$ █

christos@pleb$ ./sock_client 192.168.1.6
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 1
sock_client> n: 3
sock_client> arr[0]: 1
sock_client> arr[1]: 2
sock_client> arr[2]: 3
[sock_client] server response: 2.000
1: average
2: min and max
3: product
4: disconnect
sock_client> your choice: 4
christos@pleb$ █

# ifconfig | grep 192
    inet 192.168.1.6 netmask 0xfffff00 broadcast 192.168.1.255
# ./rpc_server

# ifconfig | grep 192
    inet 192.168.1.6 netmask 0xfffff00 broadcast 192.168.1.255
# ./rpc_client localhost
[rpc_client] accepted client at sock: 4
[rpc_client] accepted client at sock: 4
[rpc_client] sock: 4    server response: min: 1, max: 4
[rpc_client] sock: 4    server response: avg: 2.000
[rpc_client] sock 4 disconnected
[rpc_client] sock 4 disconnected

```

4 Κώδικας

Ο κώδικας είναι σχολιασμένος στα σημεία που θεωρώ ότι μπορεί να υπάρξει σύγχυση, και όχι ακόμα και σε σημεία που είναι λίγο-πολύ ξεκάθαρο το τι συμβαίνει.

4.1 rpc.x

```

struct arg_arr {
    int    n;
    int    arr<>;
};

struct arg_prod {
    float  a;
    struct arg_arr arr;
};

struct minmax {
    int    arr<2>;
};

```

```

struct float_arr {
    float    arr<>;
};

program calc_avg_PROG {
    version calc_avg_VERS {
        float calc_avg(arg_arr) = 1;
    } = 1;
} = 0x20000000;

program calc_minmax_PROG {
    version calc_minmax_VERS {
        struct minmax calc_minmax(arg_arr) = 1;
    } = 1;
} = 0x20000001;

program calc_prod_PROG {
    version calc_prod_VERS {
        struct float_arr calc_prod(arg_prod) = 1;
    } = 1;
} = 0x20000002;

```

4.2 rpc_server.c

```
#include <err.h>
#include <stdlib.h>
#include <stdio.h>

#include "rpc.h"

static void *emalloc(size_t);

static void *
emalloc(size_t nb)
{
    void *p;

    if ((p = malloc(nb)) == NULL)
        err(1, "malloc");
    return (p);
}

float *
calc_avg_1_svc(arg_arr *argp, struct svc_req *rqstp)
{
    static float result;
    int i, sum;

    for (i = 0, sum = 0; i < argp->n; i++)
        sum += argp->arr.arr_val[i];
    result = sum / (float)argp->n;

    return (&result);
}

struct minmax *
calc_minmax_1_svc(arg_arr *argp, struct svc_req *rqstp)
{
    static struct minmax result;
    int i, *min, *max;

    result.arr.arr_len = 2;
    result.arr.arr_val = emalloc(2 * sizeof(int));
    min = &result.arr.arr_val[0];
    max = &result.arr.arr_val[1];
    *min = *argp->arr.arr_val;
    *max = *argp->arr.arr_val;
    for (i = 0; i < argp->n; i++) {
```

```

        if (argp->arr.arr_val[i] < *min)
            *min = argp->arr.arr_val[i];
        if (argp->arr.arr_val[i] > *max)
            *max = argp->arr.arr_val[i];
    }

    return (&result);
}

struct float_arr *
calc_prod_1_svc(arg_prod *argp, struct svc_req *rqstp)
{
    static struct float_arr result;
    int i;

    result.arr.arr_len = argp->arr.n;
    result.arr.arr_val = emalloc(argp->arr.n * sizeof(float));
    for (i = 0; i < argp->arr.n; i++)
        result.arr.arr_val[i] = argp->a * argp->arr.arr_val[i];

    return (&result);
}

```

4.3 rpc_client.c

```
#include <sys/socket.h>
